

Stakeholder Feedback Report

Eco Bricks Creation for Plastic Waste Management

Team: Planet Protectors | Members: S Ranjith & B Lakshanyawanti | AMET University | 1M1B Green Internship – Batch 7

As part of our project implementation, we gathered direct feedback from five stakeholders — students, a homemaker, and a faculty member — to understand real-world perceptions of the eco brick initiative. Their responses reflect genuine opinions from the community we aim to serve.

#1

Gokulaprasath M

Student, AMET University

“When I first heard about eco bricks, I thought — why didn't we think of this before? It's honestly one of the simplest ideas that could make a huge difference. Imagine if every household started doing this — just stuffing their plastic waste into a bottle instead of throwing it on the road or into a bin that ends up in a dump. Plastic on the streets would become a rare sight. And if the government steps in and offers even a small incentive — say 5 or 10 rupees per bottle — people won't think twice about participating. This is the kind of initiative that starts small but has the potential to become something truly massive. I really appreciate what this team is doing.”

#2

Vivek

Student, AMET University

“Plastic waste is a real problem in my area — you see it everywhere, in drains, on roads, even near schools. So when I saw this project, it felt like something that actually makes sense. You're not asking people to do something complicated. You're just saying — collect it, stuff it in a bottle. That's it. But I think what will really push people to do it is if there's something in it for them — a small reward, recognition, maybe a certificate. People respond to appreciation. Give them a reason to participate, and you'll be surprised how many will show up. This idea can genuinely work.”

#3

Mohammed Zubair*Student, AMET University*

“ The concept itself is solid — I have no doubt about that. But what I kept thinking while learning about this is: do people actually know what to do with plastic waste? Most people just throw it wherever is convenient. Not because they don't care, but because nobody ever showed them a better way. That's where this project can make a real difference — not just by making eco bricks, but by educating people first. A simple demo, a short session, even a poster — that awareness is the foundation everything else is built on. Get the government involved too, and this can scale beyond what we can imagine.”

#4

Shanthi T*Homemaker, Local Community*

“ I really liked this idea because it's not something complicated or out of reach for ordinary people like me. At home, we have so much plastic that we don't know what to do with — covers, wrappers, bottles — and most of it just goes into the garbage. But now I see there's something useful we can do with it. My only concern is that many people might find it a bit of a task — cleaning and drying all that plastic before using it. If you can make the process a little easier and give people the right bins and guidance, I think a lot of families would happily participate. It's a good, practical idea.”

#5

Joseph Danish*Faculty Member, AMET University*

“ As someone who works in an academic institution, I can see the real potential of this project — not just as an environmental effort, but as an educational tool. When students are involved in hands-on initiatives like this, they develop a sense of responsibility that goes beyond the classroom. I would strongly recommend integrating this into college-level activities — events, competitions, awareness campaigns. With proper monitoring and data tracking in place, the team could measure impact clearly and use that as a model to inspire other institutions. This is meaningful work, and with the right structure, it can absolutely scale.”

Key Takeaways from Stakeholder Feedback

- ✓ All 5 respondents viewed eco bricks as a practical and meaningful solution to plastic pollution.
- ✓ Community incentives — such as small monetary rewards or recognition — were highlighted as key motivators for wider adoption.
- ✓ Awareness and hands-on demonstration were identified as essential first steps before large-scale implementation.
- ✓ Respondents from both academic and household backgrounds showed genuine willingness to participate.

✓ Faculty feedback emphasized the value of integrating this initiative into institutional activities for long-term impact.
